Endpoint Security

Cloud Backup

When (not if) disaster strikes, you can rest assured you won't lose any data if it's all backed up offsite. Seamless, automatic, secure, in the background, whenever your machines are online.

Fleet Encryption

After a military-grade lockdown of your computers, nobody except the authorized user will be able to even boot a machine. Except, of course, your I.T. administrators, using the decryption keys we'll securely escrow for a rainy day.

Managed Antivirus

From a centralized console, our team will make sure your machines have the latest virus protection, using anti-malware shields that provide near-perfect detection rates.

Mobile Device Management

It's no longer just about computers. Whether you're deploying company-owned smartphones and tablets, or letting your employees bring their own, you've got options for ensuring those devices are kept standardized and compliant with company security policies, so nobody walks with your data. Lost a device? Remote wipe to the rescue!

Patch Management

Ensure your computer fleet is kept updated with the latest operating system and application patches. Our team will evaluate and approve critical updates weekly. Worried about interruptions? Your employees will be able to delay non-critical updates until convenient times.

Removable Device Control

Removable media like USB and optical drives can carry malware in, and confidential information out. Our tools give you control over these vectors: you can allow secure devices only, allow only approved devices... or allow none at all.

Standardized Security Configurations

We'll ensure, via automation, that every computer in your fleet has a standardized security configuration, including complex passwords, password-protected screen savers, a standardized company administrator account, and more. Almost anything that is configurable can be automatically enforced across your entire fleet.

Cloud Security

Cloud Files Lockdown

Are you wondering which files in your Google Drive, Dropbox, or other Cloud repositories are shared outside your organization?... perhaps even to anybody on the Internet? Oops. Our tools will monitor your Cloud file stores, alert you when someone tries to publicize access to a file, and prevent users from doing it against company policy. Safe!

Cloud Single-Sign-On

Ditch your last in-house server! On- and offboard employees in seconds by creating one new account and letting the Cloud do the rest. Minimize your hackable Cloud footprint to a single, secured point. The efficiencies keep mounting!

Content Filtering & Reporting

What are your employees actually doing on the Internet all day? Now you can find out, and blacklist specific sites or activities on the device level. Does Marketing cry foul because they need Facebook? That's okay — you can whitelist it just for them... and for the CEO, of course.

Vulnerability Scanning

How do you know yesterday's equipment protects against ever-emerging threats? We'll silently scan your network perimeter monthly, testing whether your company is vulnerable to newly-discovered exploits, and fixing high-urgency vulnerabilities when discovered.

more

Email Security

Anti-Phishing Filter

Stop phishing emails before they hit your team's inboxes. We utilize the industry's most popular, most effective phishing detection filters to trash those suckers before anybody realizes they even exist. Your team will blink in amazement when they read headlines of other companies falling prey!

Anti-Ransomware Shield

Yes, Virginia, you can protect against the blight of ransomware! Our anti-ransomware software monitors your computers for suspicious encryptions. When it detects any, it grabs a copy of the original file and then stops the encrypting process in its tracks. Now you can rest easy that you won't be another victim in tomorrow's headlines.

Data Loss Prevention

Did the COO accidentally send a wire transfer to... Nigeria? Even the most sophisticated users forget that sending critical info, like bank accounts, social security, and credit card numbers, via email is a no-no. We'll monitor all your outbound email for this info and more, and stop those messages even after they hit Send!

Quarterly Phishing Simulation & Training

The biggest security hole is often human error. We'll send out monthly phishing simulation emails to your teams, disguised as regular messages. Employees who fall for it will be enrolled in one of 20 training modules. We'll provide metrics on who took the bait and the training, so you can identify who on your team needs security education and support.

Secure Email

You lose control of your emails as soon as you hit send... until now. Our secure messaging platform routes messages through a secure Cloud gateway that only you and your recipients can access. Plus, put a custom link on your website and even perfect strangers can send you encrypted email! Get back control of your email.

Threat Sandboxing

This one's really cool: Don't rely on your users to identify malicious attachments and URLs. Instead, let a robot do it! Our system will open unknown attachments and URLs in a suite of virtual OS environments and see how they behave. Green-lighted? Forward to user. Bad news? Quarantine!

Web Threat Detection

Complement traditional anti-malware protection by leveraging the data of one million Internet requests per second through global traffic analysis. Automagically identify and squash emerging malware, phishing, and other attacks within 60 seconds of emergence!

more

Tech Support and Governance

Compliance-As-a-Service	Don't fear the boogeyman. We'll coach you through an annual compliancy audit, at the end of which your organization will be certified PCI- and HIPAA-compliant. Join the club of companies who have their compliancy act together!
Fleet Health Monitoring	Keep your computers and servers productive and safe, and learn about problems before they arise. We'll monitor fleet details like backup status, malware protection status, hard drive capacity, disk errors, logic board and RAM health, battery charge capacity, and more.
Instant Onboarding	Onboarding has never been easier. After first boot, install a small software agent on a new computer it will install applications, configure preferences and policies, and make your new employee's first day (and your I.T. department's life) much smoother!
Inventory Reporting	Finance personnel have never fallen in love with you... until now. Track fleet inventory and hardware/software configurations with hundreds of data points. Ease the pain of the annual budget process by quickly identifying candidates for a fleet refresh... years in advance!
Network Monitoring	Let's get geeky for a sec: It's not just about whether your Internet is up or down. Our 24/7 monitoring platforms alert on spikes in bandwidth and interface utilization, CPU and memory, out-of-band packet errors and loss, VPN downtime, and dozens more. We also grab configuration backups every 60 seconds so you can roll back to steady-state if needed.
Standard Operating Procedures	Keep your systems organized and secure! We'll draft and implement procedures for employee on- and off-boarding, computer procurement, and equipment disposal. As a separate engagement, we'll draft critical security documents like your Acceptable Use Policy. (This Dish only available when combined with Unlimited Remote Support, below.)
Strategic Alignment	With the chaotic cadence of daily tasks, it's hard to take time for the big picture. Once per quarter or month, we'll sit down with you for a complete review of both your I.T. health, as well as the strategic initiatives you need to move. We'll create project plans, set deadlines, and execute. No more I.T. standstill — we'll help you keep it moving!
Third-Party App Deployment	Keep your configurations standardized by ensuring all the same applications are installed on all devices. From a centralized console, we'll push applications and configurations to all your computers (or a subset you specify). Streamline onboarding, and easily update devices already deployed in the field.
Unlimited Tech Support	It's hard to make Help Desk sexy... unless the people answering the phone are hired specifically because they have high Emotional I.Q.'s, deep empathy skills, and naturally live by our team's core value to Give a S**t. (Oh yeah, we might be handsome too... videochat?) We'll be a rock-solid support resource to your team whether they're at the office, telecommuting, or playing Road Warrior!
